

Easier Data Onboarding: Using AI to Improve Data Quality and CIM Compliance

PLA1040

Will Searle – PS Consultant
Splunk Hackathon Winner 2025 & 2026
LiveHybrid Ltd

What you'll leave with

How AI cuts the manual
data onboarding tax

Why grounded AI
(real CIM definitions)
beats clever prompts

A free app and a
5-step pattern to
reuse tomorrow

Data onboarding still hurts

CIM: Splunk's shared field names, so searches, dashboards and detections just work

The manual tax

- Hand-written regex for every new source
- CIM fields looked up model by model, by hand
- PII discovered after it lands in the index
- Same data, mapped differently by every engineer

What it costs

Analysts wait while sources queue behind scarce regex skills

Detections silently miss fields that never got mapped

Every new source pays the manual onboarding tax.

CIMPLicity: paste a sample, leave with config

- Free on Splunkbase (app 7945), born at Splunk Build-a-thon 2025
- Five guided steps inside Splunk Web: the mechanical 80% becomes a wizard
- Bring your own AI, cloud or fully local; key stored encrypted in Splunk

Splunk Enterprise and Cloud, version >= 9.3

App 7945

Install it now: splunkbase.splunk.com/app/7945

How it **actually** works

Five steps, left to right. The starred step is the differentiator.

1. Data Input

Paste, upload or pull live events from your indexes

2. Field Extraction

Instant local parsers, plus Ask AI for regexes and timestamps

3. CIM Mapping ★

AI grounded in your installed CIM definitions; genuine confidence and reasoning per suggestion

reads Splunk_SA_CIM on your box

4. PII Detection

100% local scan, up to 18 detectors, masking rules generated

5. Configuration

props.conf and SPL2 Ingest pipeline: copy, download, deploy

Constrained AI beats clever AI. The real CIM definitions are the constraint.

Enough slides. Watch it work.

One raw sample, about three minutes, zero hand-written regex.

Demo

Switch to demo

If catching up after conf check out the resources at:

github.com/livehybrid/PLA1040

Trusted AI is labelled AI

AI sparkle shown: data leaves Splunk

- Ask AI extraction: sends your raw sample to your endpoint
- Ask AI mapping: sends field names and sample values

"Uses the AI model set under Configuration, AI Configuration. Your sample data is sent to that service. Actions without this marker run locally in Splunk."

No badge: runs locally in Splunk

- Auto Detect and custom regex: parsed in your browser
- PII scan: scrubadub library, nothing leaves the platform
- Model auto-pick and quality score: local matching maths

Every button that sends data to an LLM says so.

The 5-step pattern

Photograph this slide. The steps outlive any tool.

1

Design

Sample your data
honestly before
automating anything

2

CIM model

Pick the target model
first, not after
mapping

3

Tooling

AI drafts extractions
and mappings, you
review

4

Validate

Prove it in dev with a
datamodel search

5

Iterate

Capture your
corrections, reuse
them next source

The tool is interchangeable. The discipline is the win.

The tax, revisited

The manual tax

- Hand-written regex for every new source
- CIM fields looked up model by model, by hand
- PII discovered after it lands in the index
- Same data, mapped differently by every engineer

What changes

- AI drafts extractions, you review each one
- Grounded in your installed CIM definitions
- Found and masked before it ships
- One vocabulary, consistent mappings

Analysts stop queueing behind scarce regex skills. Detections stop silently missing fields.

The mechanical 80% is automated. Your judgement stays on the 20%.

Take it home

The app (free)

- CIMPLicity: splunkbase.splunk.com/app/7945
- Check out my other apps such as:
 - Data Dictionary (9255)
 - UCC agentic add-on builder (9277)

The pattern (free)
